The only reliable means for preventing milk infections is pasteurization.

The only reliable means for preventing milk infections is pasteurization. This simple treatment does not change the character of the milk nor its digestibility.

We can home-pasteurize milk by bringing it to near boiling, then cool, and keep cold and covered until used.

Even entirely healthy adults who would ordinarily not be affected by impure food if they continue drinking impure milk and cream long enough will eventually undermine their natural resistance and become subject to attacks of sickness, the underlying cause of which is usually not suspected.

But children, sick people, and all who are in a rundown condition should in particular never drink raw milk or raw cream, nor eat ice cream made of them.

The Health Officer of the District of Columbia will furnish free information as to the average grade of safety of the milk and cream, raw or pasteurized, sold by any milk dealer in this city.
